## PROFESSIONAL SUMMARY

---

Software Engineer with 4+ years building React, TypeScript, C#/.NET, and Azure applications at enterprise scale. Experienced in frontend architecture, scalable backend APIs, AI-powered enterprise workflows, and end-to-end feature ownership across complex data-rich systems.

## TECHNICAL SKILLS

---

- **Languages:** C#, TypeScript, JavaScript (ES6+), Python, SQL
- **Frontend:** Next.js, React, Redux, HTML5, CSS3, Jest, Playwright, React Testing Library, TanStack Query, Styled Components, Storybook, WebSockets, Responsive Design, Accessibility (WCAG)
- **Backend:** .NET, ASP.NET Core Web API, Node.js, Express, FastAPI, JWT Authentication, REST APIs
- **Cloud & DevOps:** Microsoft Azure (App Services, Azure SQL, Azure OpenAI), Azure DevOps, CI/CD Pipelines, Docker
- **Tools:** Git, GitHub, Figma, VS Code, JetBrains Rider, SSMS, Agile/Scrum

## WORK EXPERIENCE

---

### TÜV SÜD

Dec 2022 - Present

*Software Engineer, Full Stack*

- Cut release cycle overhead by ~35% (3–4 engineering days per cycle) by architecting a schema-driven form and report engine — supporting conditional rendering, nested state, and complex validation — that let non-technical stakeholders ship inspection templates independently. Adopted across 3+ product lines and deployed cross-platform on iOS, Android, and Windows.
- Reduced analyst data retrieval time by 80% (2h → 25min) by leading frontend development and collaborating on full stack delivery of a production AI chatbot — designing the conversational UI, owning prompt design and UX refinement, and integrating a Python FastAPI backend with JWT-secured C# APIs for safe execution of model generated SQL. Deployed to 5+ enterprise clients across 3 regions.
- Owned end-to-end delivery of a React + ASP.NET Core platform supporting multi-step inspection workflows — engineering high-performance dashboards and data UIs handling large-scale datasets with 100,000+ records across 12+ countries, leveraging server-side data processing and advanced caching/prefetching strategies to cut perceived load times by up to 40%.
- Reduced per-feature development time by ~30% by designing and owning a reusable React/TypeScript component library - including cross-app design tokens and WCAG accessibility compliance - serving as the foundation for 3+ internal applications and standardizing state management architecture using Redux and React Context across a multi-team codebase.
- Led the migration of 10+ projects from SVN to Git and manual batch-script deployments to Azure DevOps CI/CD pipelines, reducing deployment time by ~70% and eliminating error-prone manual handoffs across the platform.
- Mentored junior engineers through code reviews and architecture guidance, raising overall code quality across shared internal platforms.

### Astriata

Nov 2021 - Nov 2022

*Software Engineer, Frontend / Full Stack*

- Shipped production React/TypeScript web applications for healthcare, government, and education clients using Next.js and Azure App Services, translating designs from Figma into accessible, performant components, which enabled on-time releases and improved user satisfaction.
- Built reusable component libraries adopted across 4+ client projects, reducing new project UI setup time by 30% and establishing consistent WCAG accessibility and performance standards across the org.
- Increased long-term codebase maintainability by refactoring legacy UI into scalable component architecture, collaborating directly with backend engineers and stakeholders to align delivery with business goals.

## EDUCATION

---

**New Jersey Institute of Technology (NJIT)**

2018

*Bachelor of Science, Civil Engineering*
